

ABSTRACT

A method, system, and program product is disclosed for transferring image data between a sending device and one or more receiving devices. A communication session can be established between the sending device and receiving device(s). The sending
5 device can send a notification of availability of image data on a common transmission channel and at least a portion of the image data can be transferred to the receiving device(s) on one or more data channels. A dedicated data channel can be opened up for each receiving device.
